

Agentic AI for Cloud Operations

Presented by: Shreeyansh Mittal , Aman Jain, Anuj
kumar

Project Overview

- Goal: Simplify cloud operations using natural language commands
- Key Features: VM management, networking, volume ops, and usage queries
- Tools/Tech: NLP, Cloud APIs, Automation Scripts

Functional Requirements

- FR-1: VM Provisioning
- FR-2: VM Resizing
- FR-3: VM Deletion
- FR-4: Network Creation
- FR-5: Volume Operations
- FR-6: Usage Query

System Flow

- 1. Input: User gives voice/text command
- 2. NLP Parsing → Intent Recognition
- 3. API Call → Cloud Execution
- 4. Output: Confirmation / Result

Test Case Matrix

- Test cases designed for each functional requirement:
 - - VM operations (Create, Resize, Delete)
 - - Network and Volume operations
 - - Usage query
- Covers expected input, actions, and results

Key Design Decisions

- Used natural language for user-friendly interaction
- Modular design for each resource type
- Reusable test case format for all features

Challenges Faced

- Parsing ambiguous user input
- Mapping intents to API operations
- Ensuring consistent and safe VM operations

Learnings

- Improved cloud and automation knowledge
- Built user-friendly system flow
- Gained experience in writing test cases

THANKYOU

From Our Team AIML_014
